Q2 (30 pts): Augmented Lagrangian Quadratic Program Solver

Part (A): QP Solver (10 pts)

Here we are going to use the augmented lagrangian method described [here in a video](#), with [the corresponding pdf here](#) to solve the following problem:

$$\min_x \quad \frac{1}{2} x^T Q x + q^T x \quad (1)$$

$$\text{s.t.} \quad A x - b = 0 \quad (2)$$

$$G x - h \leq 0 \quad (3)$$

where the cost function is described by $Q \in \mathbb{R}^{n \times n}$, $q \in \mathbb{R}^n$, an equality constraint is described by $A \in \mathbb{R}^{m \times n}$ and $b \in \mathbb{R}^m$, and an inequality constraint is described by $G \in \mathbb{R}^{p \times n}$ and $h \in \mathbb{R}^p$.

By introducing a dual variable $\lambda \in \mathbb{R}^m$ for the equality constraint, and $\mu \in \mathbb{R}^p$ for the inequality constraint, we have the following KKT conditions for optimality:

$$Qx + q + A^T \lambda + G^T \mu = 0 \quad \text{stationarity} \quad (4)$$

$$Ax - b = 0 \quad \text{primal feasibility} \quad (5)$$

$$Gx - h \leq 0 \quad \text{primal feasibility} \quad (6)$$

$$\mu \geq 0 \quad \text{dual feasibility} \quad (7)$$

$$\mu \circ (Gx - h) = 0 \quad \text{complementarity} \quad (8)$$

where \circ is element-wise multiplication.

```
In [ ]: # TODO: read below
# NOTE: DO NOT USE A WHILE LOOP ANYWHERE
"""
The data for the QP is stored in `qp` the following way:
    @load joinpath(@__DIR__, "qp_data.jld2") qp

which is a NamedTuple, where
    Q, q, A, b, G, h = qp.Q, qp.q, qp.A, qp.b, qp.G, qp.h

contains all of the problem data you will need for the QP.

Your job is to make the following function

    x, λ, μ = solve_qp(qp; verbose = true, max_iters = 100, tol = 1e-8)

You can use (or not use) any of the additional functions:
You can use (or not use) any of the additional functions:
You can use (or not use) any of the additional functions:
You can use (or not use) any of the additional functions:

Simulating a Falling Brick with QPs

In this question we'll be simulating a brick falling and sliding on ice in 2D. You will show that this problem can be formulated as a QP, which you will solve using an Augmented Lagrangian method.

The Dynamics

The dynamics of the brick can be written in continuous time as

$$M\dot{v} + Mg = J^T \mu$$

where $M = mI_{2 \times 2}$, $g = \begin{bmatrix} 0 \\ 9.81 \end{bmatrix}$, $J = \begin{bmatrix} 0 & 1 \end{bmatrix}$

and $\mu \in \mathbb{R}$ is the normal force. The velocity $v \in \mathbb{R}^2$ and position $q \in \mathbb{R}^2$ are composed of the horizontal and vertical components.

We can discretize the dynamics with backward Euler:

$$\begin{bmatrix} v_{k+1} \\ q_{k+1} \end{bmatrix} = \begin{bmatrix} v_k \\ q_k \end{bmatrix} + \Delta t \cdot \begin{bmatrix} \frac{1}{m} J^T \mu_{k+1} - g \\ v_{k+1} \end{bmatrix}$$

We also have the following contact constraints:

$$Jq_{k+1} \geq 0 \quad (\text{don't fall through the ice}) \quad (9)$$

$$\mu_{k+1} \geq 0 \quad (\text{normal forces only push, not pull}) \quad (10)$$

$$\mu_{k+1} Jq_{k+1} = 0 \quad (\text{no force at a distance}) \quad (11)$$

Part (B): QP formulation for Falling Brick (5 pts)

Show that these discrete-time dynamics are equivalent to the following QP by writing down the KKT conditions.

$$\text{minimize}_{v_{k+1}} \quad \frac{1}{2} v_{k+1}^T M v_{k+1} + [M(\Delta t \cdot g - v_k)]^T v_{k+1} \quad (12)$$

$$\text{subject to} \quad -J(q_k + \Delta t \cdot v_{k+1}) \leq 0 \quad (13)$$

TASK: Write down the KKT conditions for the optimization problem above, and show that it's equivalent to the dynamics problem stated previously. Use LaTeX markdown.

PUT ANSWER HERE:

KKT conditions:

$$\text{stationarity} \quad Mv_{k+1} + M(\Delta t \cdot g - v_k) - (J^T \Delta t) \mu_{k+1} = 0 \quad (14)$$

$$\Rightarrow v_{k+1} = \left(\frac{1}{M} J^T \mu_{k+1} - g \right) \Delta t + v_k \quad (15)$$

$$\text{primal feasibility} \quad -J(q_k + \Delta t \cdot v_{k+1}) \leq 0 \quad (16)$$

$$\text{dual feasibility} \quad \mu_{k+1} \geq 0 \quad (17)$$

$$\text{complementarity} \quad \mu_{k+1} \circ (-J(q_k + \Delta t \cdot v_{k+1})) = 0 \quad (18)$$

Part (C): Brick Simulation (5 pts)

```
In [ ]: function brick_simulation_qp(q, v; mass=1.0, Δt=0.01)

    # TODO: fill in the QP problem data for a simulation step
    # fill in Q, q, G, h, but leave A, b the same
    # this is because there are no equality constraints in this qp

    g = [0.0; 9.81]
    J = [0 1.0]

    qp = (
        Q=[mass 0.0; 0.0 mass],
        q=mass * (Δt * g - v),
        A=zeros(0, 2), # don't edit this
        b=zeros(0),   # don't edit this
        G=-[0.0 Δt],
        h=J * q,
```

```
)

    return qp
end
```

Part D (5 pts): Solve a QP

Use your QP solver to solve the following optimization problem:

$$\min_{y \in \mathbb{R}^2, a \in \mathbb{R}, b \in \mathbb{R}} \quad \frac{1}{2} y^T \begin{bmatrix} 1 & .3 \\ .3 & 1 \end{bmatrix} y + a^2 + 2b^2 + [-2 \quad 3.4] y + 2a + 4b \quad (19)$$

$$\text{st} \quad a + b = 1 \quad (20)$$

$$[-1 \quad 2.3] y + a - 2b = 3 \quad (21)$$

$$-0.5 \leq y \leq 1 \quad (22)$$

$$-1 \leq a \leq 1 \quad (23)$$

$$-1 \leq b \leq 1 \quad (24)$$

You should be able to put this into our standard QP form that we used above, and solve.

```
In [ ]: @testset "part D" begin
    # define qp parameters
    qp = (
        Q = [

Out[]: Test.DefaultTestSet("part D", Any[], 3, false, false, true, 1.706298874341447e9, 1.706298874342658e9, false)

Part E (5 pts): One sentence short answer

1. For our Augmented Lagrangian solver, if our initial guess for x is feasible (meaning it satisfies the constraints), will it stay feasible through each iteration?

put ONE SENTENCE answer here

A: No. If the initial guess is feasible, the constraint is not active, which implies we are doing unconstrained optimization. Consequently, during the update, the constraints might be violated.

1. Does the Augmented Lagrangian function for this problem always have continuous first derivatives?

put ONE SENTENCE answer here

A: Yes. Otherwise the Newton's method is not applicable since it requires the Hessian.

1. Is the QP in part D always convex?

put ONE SENTENCE answer here

A: Yes. The objective function is convex, and the constraints are affine.
